Undergraduate/ Graduate Student (Only) Decision Tree:

Research Decision Tree:

IRB Category of Review Decision Tree:

Appendix #1: Categories of Exempt Status:

To be classified as Exempt from Review, the project must involve **no more than minimal risk** to the subject and must satisfy one or more of the following criteria:

1. Research conducted in established or commonly accepted educational settings, involving normal educational practices, such as
 - (i) research on regular and special education instructional strategies, or
 - (ii) research on the effectiveness of or the comparison among instructional techniques, curricula, or classroom management methods.

2. Research that only includes the use of (a) educational tests (cognitive, diagnostic, aptitude, achievement), (b) survey procedures, (c) interview procedures or (d) observation of public behavior (including visual or auditory recording) if at least one of the following criteria is met:
 - (i) the information obtained is recorded by the investigator in such a manner that the identity of the human subjects cannot readily be ascertained, directly or through identifiers linked to the subjects;
 - (ii) any disclosure of the human subjects' responses outside the research would not reasonably place the subjects at risk of criminal or civil liability or be damaging to the subjects' financial standing, employability, educational advancement, or reputation.

3. Research involving benign behavioral interventions in conjunction with the collection of information from an adult subject through verbal or written responses (including data entry) or audiovisual recording if the subject prospectively agrees to the intervention and information collection and at least one of the following criteria is met:
 - (i) the information obtained is recorded by the investigator in such a manner that the identity of the human subjects cannot readily be ascertained, directly or through identifiers linked to the subjects;
 - (ii) any disclosure of the human subjects' responses outside the research would not reasonably place the subjects at risk of criminal or civil liability or be damaging to the subjects' financial standing, employability, educational advancement, or reputation.

4. Secondary research for which consent is not required: Secondary research uses of identifiable private information or identifiable biospecimens, if at least one of the following criteria is met:
 - (i) the identifiable private information or identifiable biospecimens are publicly available;
 - (ii) information, which may include information about biospecimens, is recorded by the investigator in such a manner that the identity of the human subjects cannot readily be ascertained directly or through identifiers linked to the subjects, the investigator does not contact the subjects, and the investigator will not re-identify subjects;

5. Research and demonstration projects that are conducted or supported by a Federal department or agency, or otherwise subject to the approval of department or agency heads, and which are designed to study, evaluate, improve, or otherwise examine:
 - (i) public benefit or service programs;
 - (ii) procedures for obtaining benefits or services under those programs;
 - (iii) possible changes in or alternatives to those programs or procedures; or
 - (iv) possible changes in methods or levels of payment for benefits or services under those programs.

6. Taste and food quality evaluation and consumer acceptance studies,
 - (i) if wholesome foods without additives are consumed, or
 - (ii) if a food is consumed that contains a food ingredient at or below the level and for a use found to be safe, or agricultural chemical or environmental contaminant at or below the level found to be safe, by the Food and Drug Administration or approved by the Environmental Protection Agency or the Food Safety and Inspection Service of the U.S. Department of Agriculture.

For more details, please see [45 CFR 46.104](#).

Appendix #2: Definitions:

Research: a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge.

Activities which meet this definition constitute research for purposes of this policy, whether or not they are conducted or supported under a program which is considered research for other purposes. For example, some demonstration and service programs may include research activities.

Human subject: a living individual about whom an investigator (whether professional or student) conducting research obtains (1) Data through intervention or interaction with the individual, or (2) Identifiable private information.

Intervention includes both physical procedures by which data are gathered (for example, venipuncture) and manipulations of the subject or the subject's environment that are performed for research purposes.

Interaction includes communication or interpersonal contact between investigator and subject.

Private information includes information about behavior that occurs in a context in which an individual can reasonably expect that no observation or recording is taking place, and information which has been provided for specific purposes by an individual and which the individual can reasonably expect will not be made public (for example, a medical record). Private information must be individually identifiable (i.e., the identity of the subject is or may readily be ascertained by the investigator or associated with the information) in order for obtaining the information to constitute research involving human subjects.

A **systematic** study occurs when a researcher implements or uses commonly accepted scientific methods of data collection and analysis. This collection and analysis allow for the researcher to methodically and objectively interpret the results to explore answers to predetermined questions or testing predetermined hypotheses. The approach to a study alone does not determine the need for IRB review. In many cases, people conduct interviews or draw blood for reasons that have nothing to do with research.

The statement “**designed to develop or contribute**” is interpreted as a study that produces results that are intended for dissemination outside of the University via poster presentations, professional or student conferences, any form of publication, or in any online media.

Generalizable knowledge is results intended to (1) have predictive value, (2) provide scientific clarity, and (3) be applied to a larger population in order to further scientific knowledge or inform policy. Generalizable knowledge would be applicable to a scientific community beyond the classroom and beyond the participants in the study.

Appendix #3: Student Activities Involving Human Subjects:

The IRB has identified three categories of student activities involving human subjects:

1. *Student Research*

1. "Student research" is defined as an activity undertaken by undergraduate or graduate students which meets the DHHS definition of research: "a systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge." "Student research" can take place in a class or as a faculty-directed independent study.
2. "Student research" meets the DHHS criteria for research; therefore, it is subject to IRB review at the appropriate level.

2. *The Classroom Project*

1. The "classroom project" is a class project of significant length and scope that is included in the course syllabus. The "classroom project" may involve systematic data collection and analysis and may be referred to as "research," but does not meet the DHHS definition of "research," as it is not intended to contribute to generalizable knowledge. (See I.A.1).
2. The purpose of the "classroom project" is to function as a learning tool designed to facilitate the student's mastery of research theory and practice. The purpose is NOT to "develop or contribute to generalizable knowledge," which places it outside of the definition of "research." Results of the "classroom project" may not be presented outside of the department in which the activity takes place, including publication, inclusion in theses, dissertations, or presentations in public fora.

3. *The Student Assignment*

1. The "student assignment" is a required out-of-class activity involving interviews or surveys and is one component of many in a given course. The assignment is completed and submitted for a grade in the course. It is not typically a systematic investigation, and it is not designed to contribute to generalizable knowledge.
2. Results of the "student assignment" may not be presented outside of the department in which the activity takes place, including publication, inclusion in theses, dissertations, or presentations in public fora.

Suggested Guidelines for Student Activities with Human Subjects

1. "Student Assignments" and "Classroom Projects," are activities involving human subjects that do not meet the OHRP and IRB definitions of "research." These activities, therefore, are not subject to IRB review. Such activities are identified and monitored by the Department Review Committee in the department in which the activities take place.
2. It is recommended that all faculty members and students who participate in the conduct of Student Assignments and Classroom Projects, as defined by the IRB, be familiar with the IRB definitions of these activities, and with the definition of "research" adopted by the OHRP and the TTU IRB.
3. It is recommended that all faculty members and students who participate in the conduct of Student Assignments and Classroom Activities complete CITI training for activities with human subjects, at the level suggested by the IRB. (See website training page.)
4. A [Determination Form for Human Subjects Activities](#) (DFHSA) is offered for use or adaptation at the departmental level to identify a project as belonging to the category of Student Assignment or Classroom Project. Neither the use nor the submission of this form is required by the IRB. This form may, however, be adapted for use within the department, at its discretion, and procedures for the use of the form determined by the department chair or departmental review committee.
5. Please note that any proposed student activity involving human subjects which does not meet all of the requirements and qualifications for Student Assignment or Classroom Project is considered to be "research," under the OHRP definition, and "Student Research," as defined by the IRB. The proposal for such a project must be submitted to the IRB for approval at the appropriate level of review, prior to commencement of contact with human subjects.
6. The class instructor or project supervisor should report to the Office of Research any suspected adverse events or effects involving human subjects that take place during, or as a result of, the conduct of the project or assignment.
7. Unless unavoidable, we discourage the use of human subjects that are under the age of 18 or are members of "vulnerable populations," such as pregnant women, people with mental or physical disabilities, or prisoners. Moreover, we discourage any activities that present more than minimal risk for the participants,

For additional assistance, please contact IRB@tntech.edu.

involve participation in illegal activities, involve the collection of sensitive private information, or involve the use of deception.

8. If the class instructor or supervisor feels that the use of human subjects under the age of 18 or from a “vulnerable” population or that activities involving elevated risk for the participants, illegal behavior, collection of sensitive information, or deception are necessary to fulfill the learning objective for the classroom project or student assignment, we strongly encourage them to consult with their department chairperson and other faculty within the department or college to establish internal guidelines for overseeing the activities and ensuring the safety of the human subjects and that they are treated ethically and professionally.
9. The course instructor or supervisor is solely responsible for all aspects of classroom projects and student activities. Anyone conducting any type of non-research activities should work closely with their departmental chairpersons and departmental faculty to maintain the highest professional and ethical standards."
